

Acceptability of the solution

The project seems to be quite simple to conduct. The data scientist has good data at his/her disposal and seems to have mastered his analysis. Nevertheless, the deployment of the product raises some questions. Will the company/customers easily accept a solution including AI in their daily life?

You must first convince yourself of the product's interest. Secondly, in order to defuse fears, you will need to be able to answer a number of natural criticisms about these algorithms (inhumane treatment, bias).

It is also possible that people want to understand the algorithm, which will require you to use a "simple" algorithm.
